AviationManuals Unveils New EFVS Package

The Weekly Of Business Aviation May 06, 2019

Kirby Harrison

AviationManuals, a supplier of aircraft manual development services and Safety Management System (SMS) software for business aviation, has announced a new Enhanced Flight Vision System (EFVS).

The package is designed to streamline materials required by business aviation crews and flight departments for EFVS use and includes a comprehensive manual that includes touchdown and rollout procedures, as well as LOA (Letters of Authorization) application support services, “making the development of the procedures manual and application for low visibility landings approvals much easier,” the company says.

EFVS technology is installed on most midsize and large business jets. It aids pilots flying and landing at airports with poor visibility and adds a layer of safety.

“For a pilot, this means they can land in a greater variety of weather conditions, minimizing delays or risks of being rerouted,” AviationManuals CEO Mark Baier said. “Our EFVS package can be delivered in as little as a week and quickly and efficiently provides pilots the manual and supporting equipment documents needed for approval of their LOA application.”
